Message information

Time: 4. November 2022 13:30:54
Message: Fire alarm
Message processing: Locally received
User: User 1-1
Operator station (client): Client A
Data point: DAA_000016
System: SecurFire (v6A2)
Location: C 111 Material room
Brief description: 522.01
Description: Automatic fire detector
Location: Zollikofen
Activation counter: 1

Your security management:
simple, intuitive and quick

SecuriLink UMS

Individual configuration: precise adjustment to any surroundings

With SecuriLink UMS, you can keep a close eye on all details: you configure the response on the overall system – right down to individual messages and data points.

Any security system can be connected to SecuriLink UMS, regardless of manufacturer and generation. These include intrusion and fire alarm systems, access control systems, video surveillance and others. As a result, all actions can be triggered centrally in an emergency, such as controlling interlocks, evacuating floors or opening gates for response services.

The benefits to you

- Efficient solution with comprehensive, central operation of all security systems
- Easy operation with optimised user interface
- Clear visualisation of the relevant information, optimised according to the respective situation
- Targeted actions, with structured, assisted and guided message processing and workflow

Your powerful security management system: because every second counts

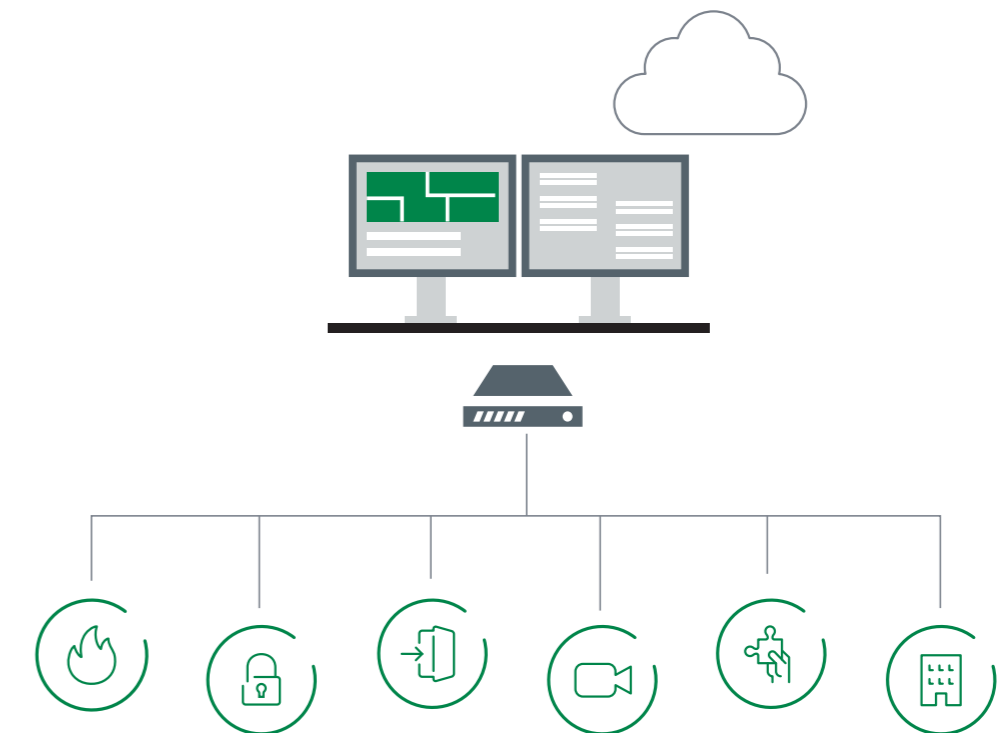

Knowing that your staff will react correctly in an emergency is very reassuring. The SecuriLink UMS security management system gives them the tools they need to do this.

A security incident can be a very hectic situation, meaning it is not always easy to maintain a clear overview and take the necessary steps quickly. This is where an intelligent security management system comes into its own, giving clear information, guiding the users directly to the correct decisions and ensuring the event is tackled successfully as a result. SecuriLink UMS takes care of these tasks seamlessly, reliably and with confidence. The universal management system for your security infrastructure offers an intuitive user interface that limits the information shown to the most important aspects. Thanks to the stored solution options, reaction times for appropriate interventions are kept to a minimum.

Whether fire or intrusion alarm systems, access control systems or other aspects of security infrastructure, SecuriLink UMS interfaces with the reporting protocols of all important manufacturers to form a powerful, overarching solution that optimises the flow of information ensures suitable actions.

SecuriLink UMS – security at a glance

- Rapid overview: ergonomic user interface for complex security systems
- Clear: uniform graphic visualisation of messages and states on all connected systems
- Simple orientation: floor plans with interactive display and operation zones
- Scalable display: all information can be displayed on one or multiple screens
- Precise reactions: guided event management with dynamic additional information and interactive reports

SecuriLink UMS is the key to successful security management. Thanks to the integration of all security systems, the system ensures a clear overview in even the most complex situations.

SecuriLink UMS: perfect for every application

Data centres

Without a doubt, many companies would come to a standstill without a functioning ICT infrastructure. Server rooms in SMEs, mobile telephony base stations and large data centres play a key role. Protecting them from all possible eventualities is a complex task. Classic security systems, HVAC systems (heating, ventilation, air conditioning) and other data sources all provide a wealth of information that SecuriLink UMS manages centrally.

Museums and trade fairs

Whether protecting people and valuable objects or detecting potential events in good time, SecuriLink UMS supplies all the required information instantly from all connected systems. Valuable decision-making criteria are provided through the intelligent linking together of individual pieces of information – the whole is greater than the sum of its parts.

Shopping centres

Shopping centres welcome thousands of visitors daily, and they all have to be kept safe. SecuriLink UMS excels here with its central intelligence. The security management systems installed throughout the buildings can be controlled uniformly and all events processed from a single location. The event-based display of all relevant information – such as video images and graphic displays – ensures a clear overview.

Industry

Requirements for security-related information in industry are as diverse as the enterprises themselves. Secure environments are just as important for the pharmaceuticals industry as for food production or processing raw materials. SecuriLink UMS provides the right set of tools and information for every need, allowing you to keep full control at all times.

Prisons

Prisons are operated under the strictest security requirements. Employees in the security offices have to maintain a clear overview in any situation and keep everything under control – for the safety of everyone both inside and outside the prison walls. Whatever the situation, receiving the required information at all times and taking the right action is essential. SecuriLink UMS can play a critical role here.

Sport and recreation

Stadiums see several thousand people meet in one place, often with a high degree of potential conflict between different groups of fans. Keeping a clear overview at all times and reacting correctly in critical situations is essential. Thanks to SecuriLink UMS, staff in the Security Operations Centre can provide on-site security staff with the correct information instantly and give optimal remote guidance.

Intuitive operation: rapid responses guaranteed

A clear overview for maximum security – intelligent security management allows you to overcome even the most complex situations.

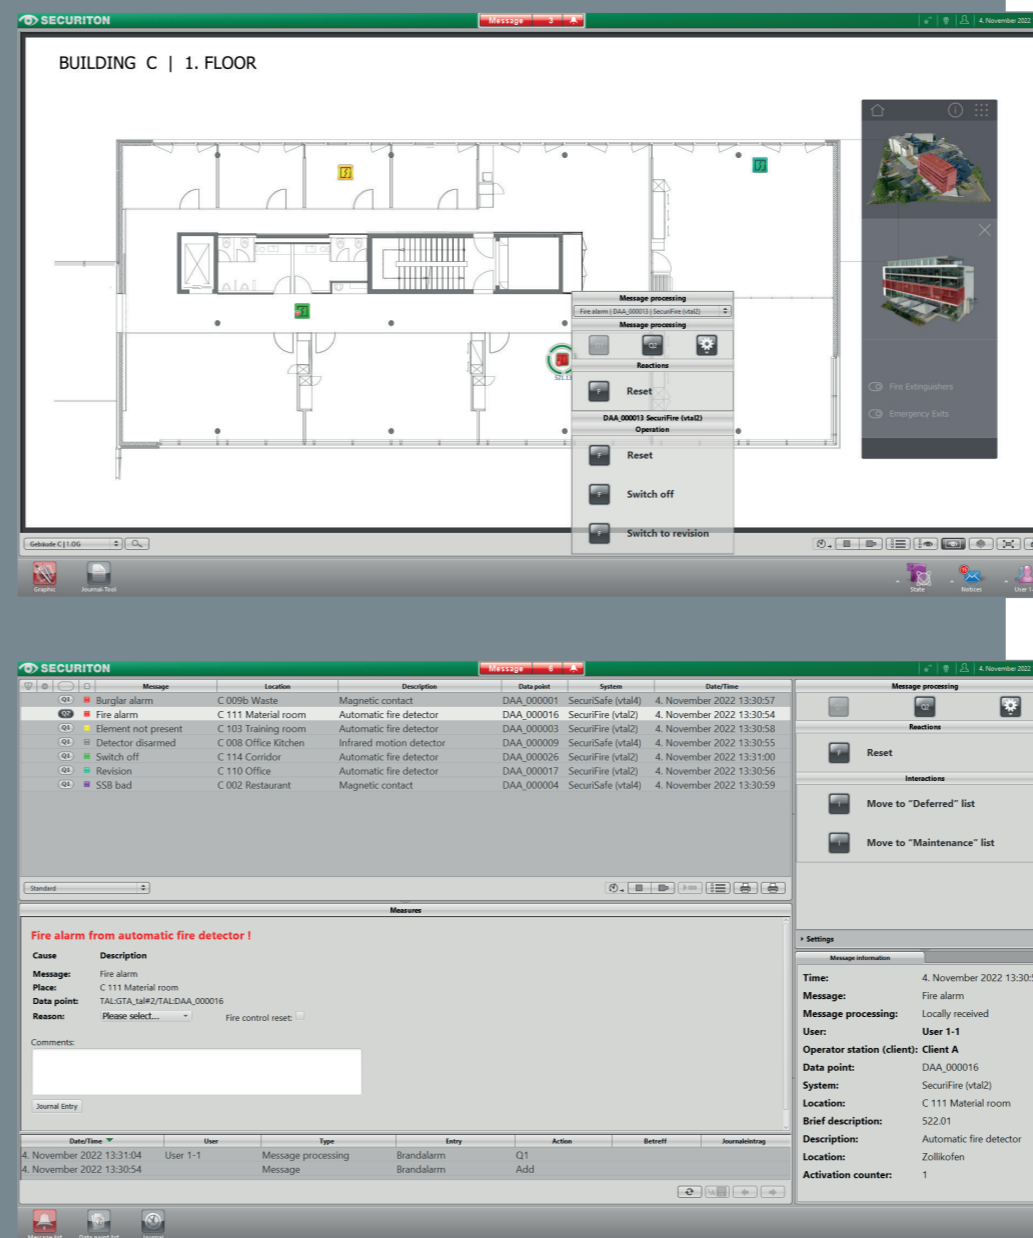

In an emergency, SecuriLink UMS provides you with an overview of the situation that summarises all incidents clearly. The system automatically orders complex situations and prioritises them according to their relevance.

In crisis situations, everybody is under stress. This is the time when operating systems correctly and eliminating potential sources of error is decisive. SecuriLink UMS effectively defuses critical situations by supplying the most relevant information and providing instructions on solving problems. A detailed, zoomable graphic interface with photos, floor plans and detector positions gives an overview of the situation that is absolutely unrivalled. Thanks to this effective support, even staff without advance knowledge of security technology or IT can operate the system without any problems.

SecuriLink UMS – security in every situation

- Support in crisis situations with sophisticated ergonomic features
- Quick overview with structuring and prioritising of information
- Guided troubleshooting with automatically generated instructions
- Outstanding protection thanks to encrypted communication and clearly assigned access authorisation
- Seamless logbook for reporting all system activities

The user interfaces on the different applications in SecuriLink UMS have been optimised and provide information in a clear, consistent and easily understandable way. Pop-ups and floating, overlapping windows are largely dispensed with. This allows users to always work in familiar surroundings, which has a calming influence in stressful situations and promotes quick reactions. They are also helped by a transparent, easy-to-operate user panel in full-screen mode. This intuitive operating philosophy has proven itself and is appreciated by our customers around the world.

The perfect overview on the SecuriLink UMS user interface: graphic application (top) and message list application (bottom).

Outstanding flexibility

Thanks to its modular design, SecuriLink UMS can be used both as a single-station system and also in major companies with multiple workplaces and dozens of connected security systems. If your operating requirements change, SecuriLink UMS can be expanded at any time.

A suitable topology solution – single server, multi server or multi site – is available for all requirements, from simple to complex and connected. SecuriLink UMS uses a high-quality, vector-based graphic format for its displays.

Cybersecurity

SecuriLink UMS features outstanding protection against both internal and external attacks. This includes comprehensive, tailored cybersecurity measures. The seamless encryption of the entire communication is absolutely unique, with data unable to be tapped or manipulated. Password protection ensures only people with the necessary authorisation can access the system. Afterwards, you can reconstruct and analyse both the event itself and the actions taken. All manipulation attempts on the system are also detected immediately, offering effective protection against insider threats.

The right information at the right time
with the right display and the right
measures.

SecuriLink UMS – your guarantee for seamless security.

Applications: alert around the clock

SecuriLink UMS and its intelligent functions are always on, which makes the universal management system the gold standard in many locations.

In any application where interruption-free 24/7 operation has to be guaranteed, only perfect solutions are acceptable. As a result, the remote monitoring and remote control functions on SecuriLink UMS are of exceptional value here:

- Security Operations Centres (SOC) operating 24/7
- Financial institutes
- Trade organisations
- Production facilities spread over large areas

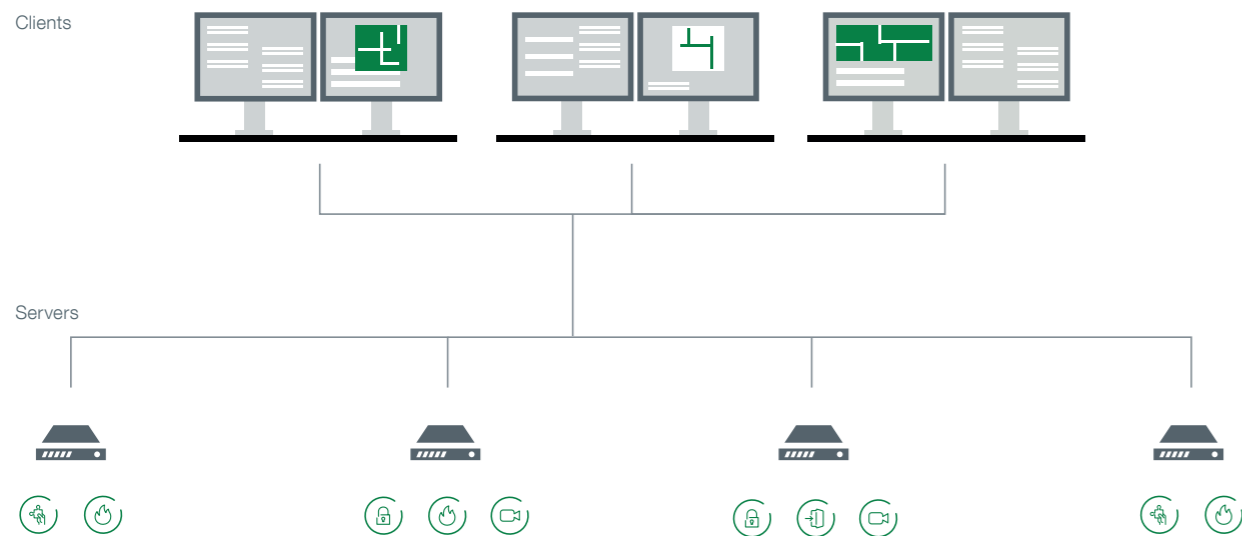

Many other branches and organisations also rely on SecuriLink UMS to provide the greatest possible protection for people and property:

- Industrial facilities
- Service centres and hotels
- Casinos, trade fairs and exhibitions
- Data centres, IT and telecommunications centres
- Energy supply plants

- Public administration, prisons, armies
- Hospitals and nursing homes
- Central warehouses, department stores and shopping centres
- Private individuals

Security management with SecuriLink UMS – your benefits

- Flexibility: fast adaptation to new requirements
- Holistic solution: includes all aspects of security requirements
- Security: fast reactions, encrypted communication
- Cost-effective: simple configuration, minimal maintenance
- Safe investment: integrates existing and future systems
- Experience, know-how and Swiss quality: SecuriLink UMS is a proprietary development from Securiton, Switzerland's leading security specialist

As individual as your needs: SecuriLink UMS always offers the optimal topology for every challenge.

Highlights of SecuriLink UMS

1 million links

SecuriLink UMS manages thousands of data points, numerous connected security systems, comprehensive functions and hundreds of graphics with ease. Depending on the configuration, this results in hundreds of thousands of links and monitoring points. These are sent to your users by the system in the right quantities and displayed appropriately.

75 connected systems

A single server can manage over 75 connected intrusion and fire alarm systems – around the clock and with outstanding reliability and stability.

773 base packets

Almost 800 SecuriLink UMS base packets are installed around the world, carrying out valuable services every single day.

39 845 data points

The number of connectible data points is unlimited. Will you be able to outdo the largest current system with just under 40,000 data points with your Securiton project?
